FC × attention cross score, one dot per crossbar config (R × C)
closer to the origin is better; d = distance from the origin
closest: 256x64, d = 0.539

d = 0.2
Pareto front
dominated
closest to the origin
d = 0.539: nothing closer
equal distance d
ideal: best on every workload
of both families
attention: 1 − EDAP score (1 − G_ATT, geomean over the 6 attention workloads)
FC: 1 − EDAP score (1 − G_FC, geomean over the 4 FC workloads)
