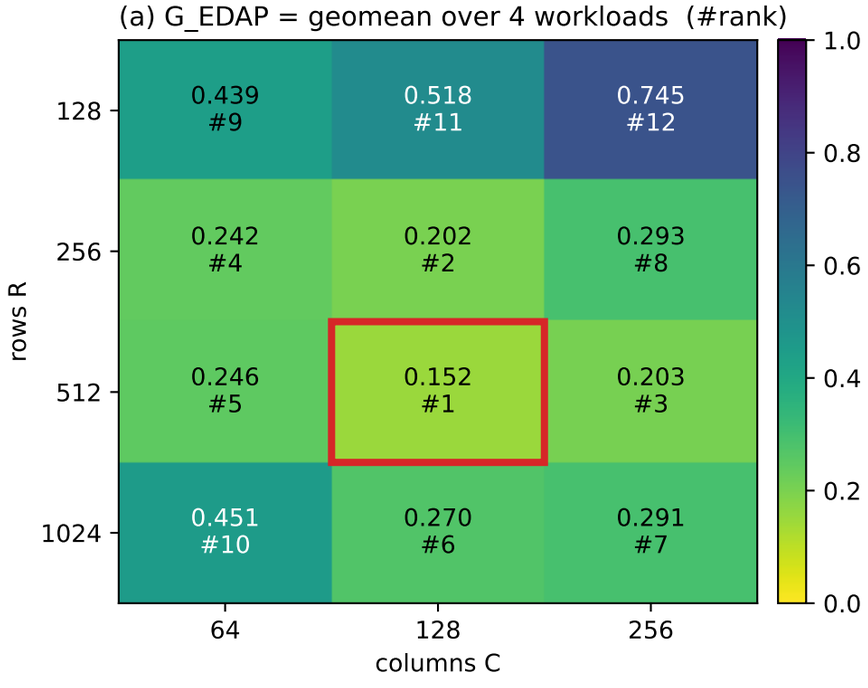
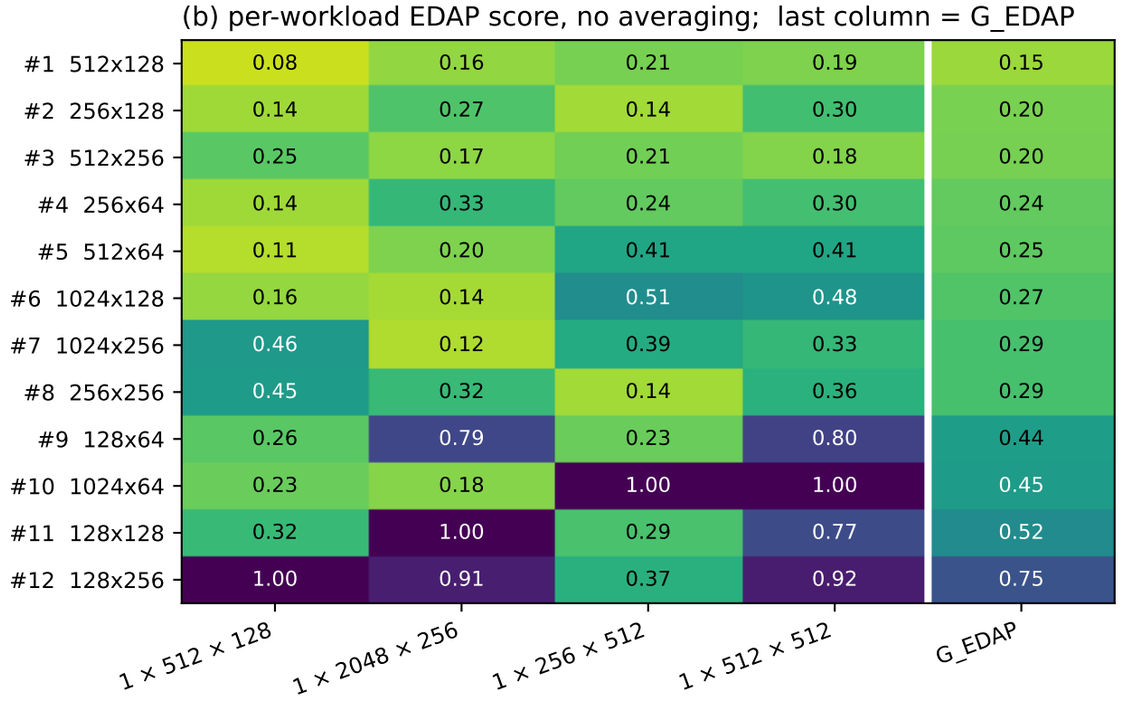
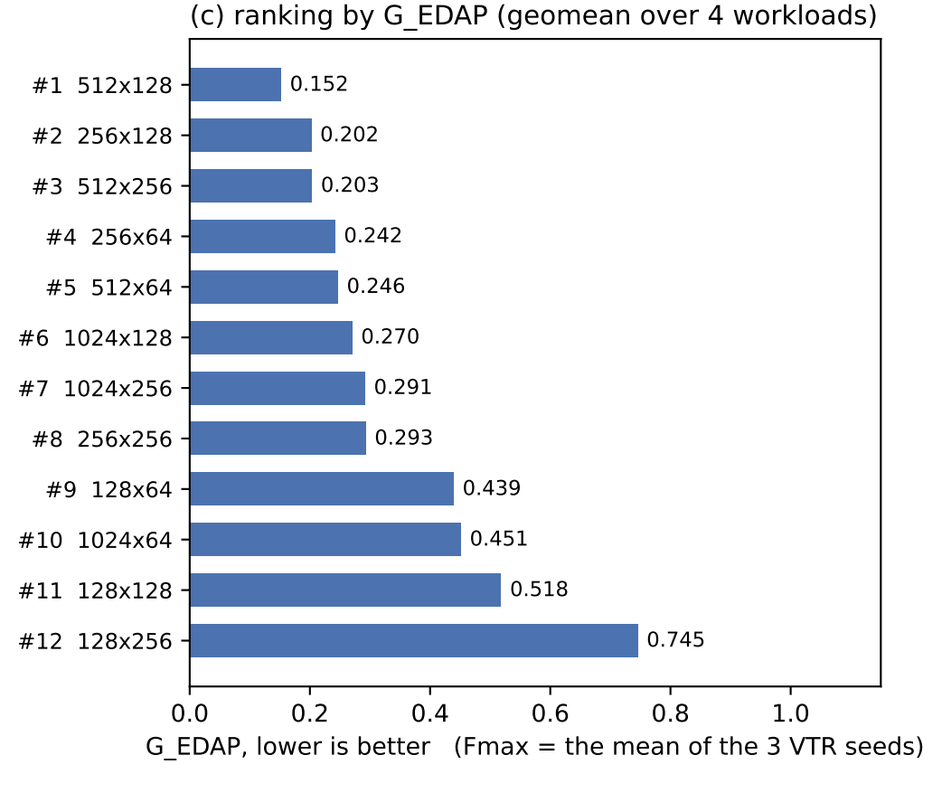
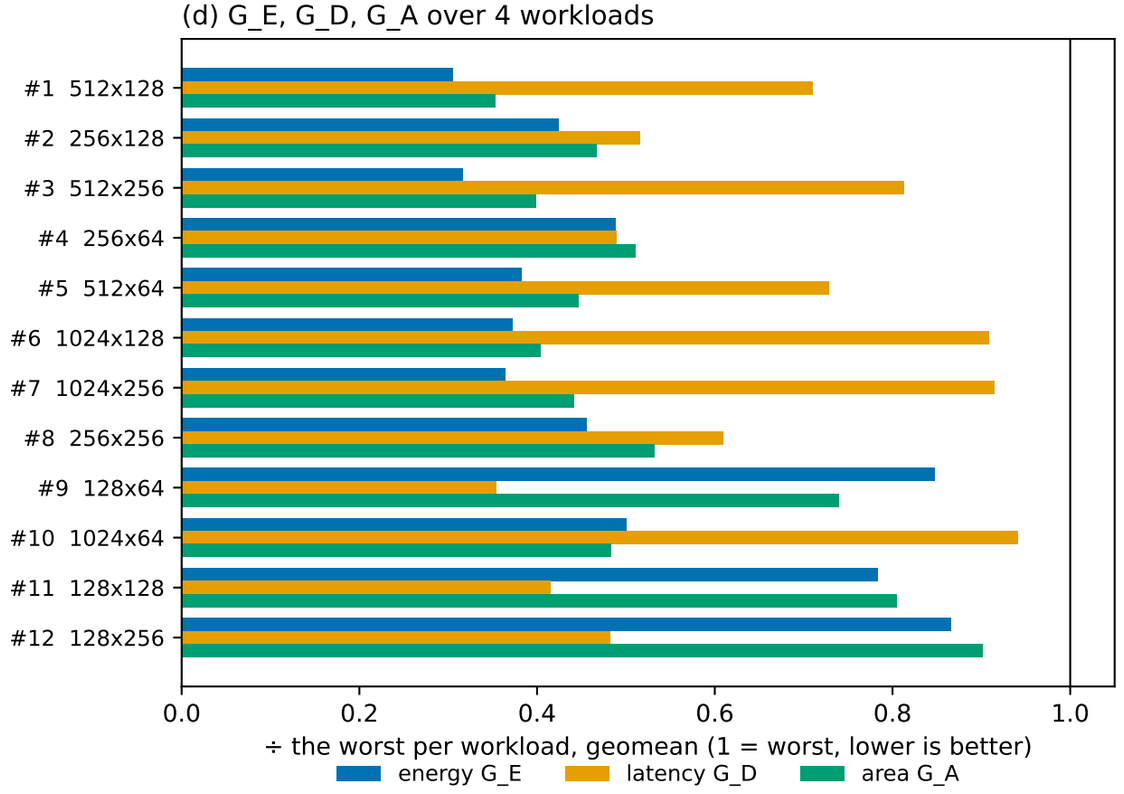
FC — crossbar ranking by EDAP








Workloads (4): GEMV M × K × N = 1 × 512 × 128, 1 × 2048 × 256, 1 × 256 × 512, 1 × 512 × 512 (the v2 FC snapshot, rebuilt by the v3 model)
EDAP = energy × latency × area. Per workload: score = EDAP ÷ the worst config's EDAP (1 = worst, lower is better). G_EDAP = geomean of the 4 scores.
